1. Reducing Cognitive Load through "Satisficing"

Mothers—especially those like Savitri or Pravara—often experience high cognitive load due to sleep deprivation and physical recovery. The IA minimizes this by:

- **Recognition over Recall:** Instead of forcing users to remember technical terms or search through folders, the IA uses **pictorial menus** and **audio feedback**. Seeing an image of *Methi Khichdi* is a faster "System Image" than reading a nutrient breakdown.
- **Universal Entry Point:** The **Voice FAB** acts as the primary hub. A user doesn't need to know *where* the Symptom Checker is; they simply tap the hub and speak, reducing the planning stage of the Human Action Cycle.
- **Microbreak Optimization:** Features like the "Weekly Feedback Loop" are designed for under-2-minute interaction bursts to respect a mother's limited downtime.

2. Bridging the "Mental Model" Gap

Research shows mothers often feel caught between a doctor's advice and their family's traditions. The IA solves this by:

- **The Science Bridge (F2):** We do not hide traditional beliefs. By grouping **"Dadi Maa vs. Doctor"** cards directly within the meal and health spokes, we align the app with the user's

cultural reality.

+2

- **Regional Labeling:** We replaced clinical jargon with familiar labels. For example, the "Personalised Dietary Planning Engine" is presented as "**Mera Khana**" (**My Meals**), which matches the user's internal language and reduces the "interpretation" effort.
-

3. Human-Machine Task Distribution

The structure is designed so the **Machine** handles "Hard Execution" and the **Human** handles "Goal Formation":

- **The Cook Helper (F8):** The mother forms the goal ("I need my cook to get ingredients"). The IA then delegates the "Repetitive Processing" to the machine, which calculates exact quantities and formats a **WhatsApp message** for her personal assistant.
 - **Automated Tracking:** By using the **AI Meal Photo Analyser (F5)**, the user avoids the tedious task of manually logging calories. The machine interprets the "System Status," and the user simply evaluates the outcome.
-

4. Efficient Navigation & Safety

To prevent "lostness" and ensure safety, the IA follows a strict hierarchy:

- **≤3 Step Rule:** Core tasks—notifying a cook, scanning a meal, or checking a symptom—are designed to be no more than three taps or one voice command away from the Home Hub.
- **Prospective Memory Support:** The **Top-Bar Reminders (F9)** stay visible across all screens. This acts as a persistent nudge, ensuring critical health tasks are not forgotten during the chaos of childcare.
- **Error Recovery (User Control):** In line with Nielsen's 3rd Heuristic, the user maintains "User Control and Freedom". If a user makes a mistake—such as accidentally logging a meal or marking a pill as "Done"—they can simply tell the **Voice Assistant (F1)** to "undo," and the system will update its internal data and progress bars accordingly.
- **Emergency Escalation:** For high-risk profiles, the **Symptom Checker (F6)** includes an "Emergency Escape Hatch" that bypasses normal navigation to alert a connected doctor or ASHA worker immediately.
