## User Research Goal

Our goal is to understand the daily habits of first-time mothers how they track their pregnancy, learn about their health, and connect with other mothers online . We want to learn what makes them trust a digital tool so we can design a simple, easy-to-use platform that brings tracking, simple education, and safe community support into one place.

---

## Research Objectives and Questions

**Objective 1:** Understand how mothers look for and read pregnancy information.

Link to Literature Theme: Simple and Culturally Adapted Content. The literature shows that digital tools fail when they use college-level reading words and ignore a user's local language or culture. First-time mothers need health information that is simple, easy to read, and useful for their daily lives .

### Research Questions (Behavior-based):

1. Tell me about the last time you searched for information about your pregnancy online. Where did you look and how did you do it?
2. How do you usually decide if the health information you find online is safe and true?
3. Can you share an example of a time when you found pregnancy advice confusing or hard to read? What did you do next?

**Objective 2:** Discover how mothers feel about using AI or chatbots for health advice.

Link to Literature Theme: Trust and the Limits of AI. The literature highlights that users trust apps more when doctors back them up. While AI can give quick, personal answers, mothers still prefer to see a real doctor face-to-face for serious medical issues.

### Research Questions (Behavior-based):

1. Tell me about a time you used a chatbot or AI tool to ask a health question, if you ever have. How did you feel about the answer it gave you?
2. How do you usually handle it when you have a sudden health question during the day or late at night?
3. Tell me about a situation where you would rather speak to a real doctor face-to-face instead of using an app on your phone.

**Objective 3:** To examine the interaction behaviors of mothers within digital support groups and determine which features foster trust and emotional well-being versus those that cause anxiety or platform fatigue.

**Research Questions (Behavior-based):**

1. How do you usually stay in touch with other pregnant women or new mothers to share your feelings?
2. Tell me about a time you visited an online forum. What were you looking to find?
3. Can you share an experience where an online mom group made you feel worried or stressed instead of helping you?

**Objective 4:** Learn how mothers track their baby's growth and their own health.

Link to Literature Theme: Poor Visuals and Having Too Many Apps. First-time mothers rely heavily on apps because they have never been pregnant before. The literature shows users are frustrated by apps with bad pictures, glitches, and having to jump between many different apps just to track their health, learn, and chat with others.

**Research Questions (Behavior-based):**

1. Tell me about how you keep track of your pregnancy milestones or your baby's growth each week.
2. Walk me through how you use your favorite pregnancy apps on a normal day. What are you mostly looking at?
3. Tell me about the last time a pregnancy app frustrated you or didn't show you the details you wanted to see.
