TASK FLOW

Flow 1: Delegated Ingredient Sourcing (The Cook Helper)

Goal: Mother ensures her personal cook buys the correct regional ingredients for a medically-prescribed recovery meal.

Home Dashboard (Today's Meal Card) → User taps "Notify Cook" Icon → AI extracts specific raw ingredients and quantities from the Regional Recipe Database → System triggers WhatsApp deep-link → WhatsApp opens with pre-filled regional text: *"Please buy 250g moong dal and drumstick leaves for today's lunch"* → Cook receives structured list → Success: User sees "List Sent" status on Home Screen.

Flow 2: Voice-First Symptom Triage & Expert Escalation

Goal: User identifies a health risk (e.g., dizziness) and receives a validated dietary fix or medical escalation.

Persistent Voice FAB (Bottom Right) → User speaks: *"I feel very dizzy"* (Audio Input) → AI asks 2-3 follow-up questions about duration and diet → User responds via Voice → AI Decision Gate: Severity Check (Machine handles Execution) → [If Non-Critical] AI suggests iron-rich regional snack + Updates tomorrow's meal plan → [If Critical] System displays high-contrast "Emergency: Call Doctor" button + Notifies Connected Physician via App ID.

Flow 3: AI Meal Photo Audit & Feedback

Goal: Log an unscheduled meal to see its impact on daily nutritional progress.

Bottom Navigation (Camera Icon) → User captures photo of plate → AI identifies dish and automatically estimates portion size (Satisficing) → UI displays color-coded bars for Iron, Folate, and Calcium (Evaluation) → User taps "Add to Today's Log" → Home Screen Dashboard updates → Notification: *"Progress updated! You need a bit more calcium at dinner."*

1. Heuristic Evaluation (Nielsen's 10 Heuristics)

Heuristic	Application in MaaHealth Design
1. Visibility of System Status	Nutrition Progress Bars on the Home screen provide real-time visual feedback on nutrient intake (Iron, Folate, Calcium).
2. Match System & Real World	Uses regional food names (e.g., <i>Pesarattu</i> , <i>Litti Chokha</i>) and local measurement units like <i>katori</i> or <i>glass</i> instead of grams or milliliters.
3. User Control & Freedom	Users can "Undo" any action (like an accidental meal log) via the Voice Assistant to maintain data accuracy without frustration.
4. Consistency & Standards	Employs a uniform card design for all interactive content, whether it is a daily meal, a "Dadi vs. Doctor" fact, or a cook's profile.
5. Error Prevention	The Symptom Checker includes safety flags that automatically trigger medical escalation for high-risk symptoms.
6. Recognition over Recall	Prioritizes pictorial menus and voice prompts over text-heavy lists, reducing the need for users to memorize technical health terms.
7. Flexibility & Efficiency	The Hub-and-Spoke model allows power users to use voice shortcuts while providing a simple tap-flow for low-literacy users.
8. Aesthetic & Minimalist Design	Uses progressive disclosure; core information is shown first, while deep nutritional data is hidden behind a "show more" interaction.
9. Help Users Recover from Errors	If the AI cannot identify a photo, it presents the top 3 possible options for the user to select, rather than a generic failure message.
10. Help & Documentation	Every recommendation includes an in-line "Why?" button explaining the clinical benefit in simple regional language.

2. Design Justification (HCI Foundations)

The design of MaaHealth is justified by four core HCI pillars that transform it from a simple app into a supportive care ecosystem.

A. Bridging the Mental Model Gap

Users often experience conflict between traditional beliefs and clinical advice.

- Justification: The Science Bridge (F2) does not dismiss tradition. By acknowledging the "Home Wisdom" first, the app aligns with the user's internal mental model before introducing the "System Image" (clinical evidence).
- Benefit: Increases Perceived Usefulness and Trust—two critical factors in the Technology Acceptance Model (TAM).

B. Human-Machine Task Distribution

The app is designed to handle "heavy" cognitive tasks, leaving high-level decisions to the mother .

- Justification: In the Cook Helper (F8) flow, the machine performs the complex task of extracting raw ingredients and quantities from a recipe.
- Benefit: Reduces the mother's cognitive load; she only needs to approve the delegation, while the system handles the logistical "math".

C. Supporting Prospective Memory

Sleep deprivation in postpartum mothers leads to high forgetfulness.

- Justification: The Persistent Top-Bar Reminder (F9) stays visible across all screens.
- Benefit: Acts as an external memory aid, ensuring critical goals (like taking iron supplements) remain top-of-mind until the action is completed.

D. The Human Action Cycle (Evaluation)

Effective design must help users understand the outcome of their actions.

- Justification: Every logged meal or pill is met with immediate audio and visual feedback (congratulatory message + updated bars).
- Benefit: Closes the Gulf of Evaluation, providing the "Instant Gratification" needed to sustain long-term behavior change.
